

Tips and other Considerations before installing PEEL N STICK® Brass seal in wood Double Hung Windows

Ventilation from Both Sashes is Required

If ventilation from both sashes is required and sash weighted balance system is currently used and there is a requirement to control air infiltration you may want to consider PEELNSTICK Brass seal for sealing two sides and the header (top of the sash) as well as two sides and the sill of the Lower sash. See Disassembling a Wood Double Hung Window.

Large Sashes

If the sashes are large (wide and /or high) the weight of the sash will prohibit the lowering or raising of these sashes except under very controlled conditions. Shear weight of the sash will not allow friction and springs to control the height of these sashes. Special balance systems are required.

Extremely Loose Fitting Sashes

If the sashes are extremely loose fitting in the window frame that is they not only wiggle when pushed from side to side but cock more than a couple of degrees you may want to consider replacing these sashes. Or you can save these sashes by attaching runners on the sides And then using PEELNSTICK®.Brass weatherstripping to stop the air infiltration

Covering the sash corner where the ropes were connected

In historical prservation you can use brass coil or if aesthetics are not important aluminum coil stock to cover the corner.

Replace Dry-Rot Sashes

If you plan to replace dry-rot sashes make your measurements for the sash width and height with PEEL N STICK® Brass seal installed or subtract about 3/16" from the opening width measurement and 3/32" from each sash height measurement.

Save a Lot of Money.

If the windows are never opened or air conditioning is in use or planned you may want to consider not only PEEL N STICK® Brass seals to stop heat loss due to air infiltration but KEL-EEZ® ThermoBarriers™ storm windows to lower radiant heat loss and save a lot of money.
